

This image of material reality is now so vacillating and uncertain as it has not been for a long time. We know a lot of interesting details, and we learn new things every week, so to speak, but it is a matter of the impossibility of finding out from the basic conceptions that really stand firm and build a clear, easy-to-grasp framework for our concept of matter. A framework of which one could say: it is quite certain, we all believe that today. This is unfortunately impossible.
